

Stage 1
Corpus
boundary

Wikipedia category tree
(Categoría:Familias_de_<País>)

Recursive crawl
through subcategories

Biography URLs per family
(743 family categories, 10 countries)

iterate

Stage 2
Entity
extraction

Biography page
(infobox + prose)

Structured-field extraction
surname, kin relations,
office, party, alma mater

Per-person record
surname_i, spouse_j (URL),
parent_k (URL), office_m, ...

for each relation

Stage 3
Entity
resolution

Hyperlink matching
does relation(A, name_B)
link to a scraped URL for B?

Resolved edges
8,201 / 14,190 (57.8%)
kinship statements resolved
to a second scraped biography

Multiplex graph assembly
kinship + party +
education + succession

Stage 4
Corpus
aggregation

Working corpus
6,169 individuals · 8,201 kinship edges
743 families · 10 countries
